## Criteria

**Criteria Must Meet One of the Following:**

1. The member has experienced 3 or more prior failed IVF attempts (inappropriate follicular stimulation). If there are fewer than 3 attempts, there is medical documentation that additional IVF cycles with the member’s oocytes are unlikely to result in a conception.

2. The member has been diagnosed with gonadal dysgenesis (i.e. Turner syndrome).

3. The member had a bilateral oophorectomy.

4. The member has premature ovarian failure or ovarian failure subsequent to chemotherapy or radiation therapy.

5. The infertile member is at high risk of transmitting a genetic disorder to her offspring.

**NOTE:** Assisted embryo/oocyte hatching (89253) has been demonstrated to be effective only after multiple failed IVF cycles. In addition, assisted hatching has not been demonstrated to result in higher live birth rates.
